Cultivating Complex Analysis: The logarithm (4.1.1)

Jiří Lebl

Departemento pri Matematiko de Oklahoma Ŝtata Universitato

Consider the primitive of z^n.

Consider the primitive of z^n.

If $n \neq -1$, the primitive is $\dfrac{z^{n+1}}{n+1}$ (not defined at $z = 0$ if $n + 1 < 0$)

Consider the primitive of z^n.

If $n \neq -1$, the primitive is $\dfrac{z^{n+1}}{n+1}$ (not defined at $z = 0$ if $n + 1 < 0$)

What about $z^{-1} = {}^1\!/_z$?

Consider the primitive of z^n.

If $n \neq -1$, the primitive is $\dfrac{z^{n+1}}{n+1}$ (not defined at $z = 0$ if $n + 1 < 0$)

What about $z^{-1} = {}^{1}\!/_{z}$?

Consider the *slit plane*

$$U = \mathbb{C} \setminus (-\infty, 0] = \mathbb{C} \setminus \left\{z \in \mathbb{C} : \operatorname{Re} z \leq 0, \operatorname{Im} z = 0\right\}.$$

Consider the primitive of z^n.

If $n \neq -1$, the primitive is $\dfrac{z^{n+1}}{n+1}$ (not defined at $z = 0$ if $n + 1 < 0$)

What about $z^{-1} = {}^1\!/_z$?

Consider the *slit plane*

$$U = \mathbb{C} \setminus (-\infty, 0] = \mathbb{C} \setminus \{z \in \mathbb{C} : \operatorname{Re} z \leq 0, \operatorname{Im} z = 0\}.$$

U is star-like $\Rightarrow$ holomorphic functions on U have a primitive on U, including ${}^1\!/_z$.

Consider the primitive of z^n.

If $n \neq -1$, the primitive is $\dfrac{z^{n+1}}{n+1}$ (not defined at $z = 0$ if $n + 1 < 0$)

What about $z^{-1} = {}^1\!/_z$?

Consider the *slit plane*

$$U = \mathbb{C} \setminus (-\infty, 0] = \mathbb{C} \setminus \{z \in \mathbb{C} : \operatorname{Re} z \leq 0, \operatorname{Im} z = 0\}.$$

U is star-like $\Rightarrow$ holomorphic functions on U have a primitive on U, including ${}^1\!/_z$.

Require this primitive to be 0 at $z = 1$ to obtain the *principal branch* of the logarithm:

$$\operatorname{Log}\colon U \to \mathbb{C}$$

Consider the primitive of z^n.

If $n \neq -1$, the primitive is $\dfrac{z^{n+1}}{n+1}$ (not defined at $z = 0$ if $n + 1 < 0$)

What about $z^{-1} = {}^1\!/_z$?

Consider the *slit plane*

$$U = \mathbb{C} \setminus (-\infty, 0] = \mathbb{C} \setminus \{z \in \mathbb{C} : \operatorname{Re} z \leq 0, \operatorname{Im} z = 0\}.$$

U is star-like $\Rightarrow$ holomorphic functions on U have a primitive on U, including ${}^1\!/_z$.

Require this primitive to be 0 at $z = 1$ to obtain the *principal branch* of the logarithm:

$$\operatorname{Log}\colon U \to \mathbb{C}$$

We want to show $\operatorname{Log} z = \log|z| + i \operatorname{Arg} z$ (principal branch of the argument).

Set $L(z) = \log|z| + i \operatorname{Arg} z$ (WTS that $L = \operatorname{Log}$).

Set $L(z) = \log|z| + i\,\mathrm{Arg}\,z$ (WTS that $L = \mathrm{Log}$).

$L(1) = 0 = \mathrm{Log}(1)$, good!

Set $L(z) = \log|z| + i \operatorname{Arg} z$ (WTS that $L = \operatorname{Log}$).

$L(1) = 0 = \operatorname{Log}(1)$, good!

$e^{L(z)} = e^{\log|z|} e^{i \operatorname{Arg} z} = |z| e^{i \operatorname{Arg} z} = z.$

Set $L(z) = \log|z| + i \operatorname{Arg} z$ (WTS that $L = \operatorname{Log}$).

$L(1) = 0 = \operatorname{Log}(1)$, good!

$e^{L(z)} = e^{\log|z|} e^{i \operatorname{Arg} z} = |z| e^{i \operatorname{Arg} z} = z.$

L is the inverse of the exponential $\Rightarrow$ L is holomorphic.

Set $L(z) = \log|z| + i \operatorname{Arg} z$ (WTS that $L = \operatorname{Log}$).

$L(1) = 0 = \operatorname{Log}(1)$, good!

$e^{L(z)} = e^{\log|z|} e^{i \operatorname{Arg} z} = |z| e^{i \operatorname{Arg} z} = z$.

L is the inverse of the exponential $\Rightarrow$ L is holomorphic.

Differentiate $z = e^{L(z)}$:

Set $L(z) = \log|z| + i \operatorname{Arg} z$ (WTS that $L = \operatorname{Log}$).

$L(1) = 0 = \operatorname{Log}(1)$, good!

$e^{L(z)} = e^{\log|z|} e^{i \operatorname{Arg} z} = |z| e^{i \operatorname{Arg} z} = z.$

L is the inverse of the exponential $\Rightarrow$ L is holomorphic.

Differentiate $z = e^{L(z)}$: $1 = L'(z) e^{L(z)} = L'(z) z.$

Set $L(z) = \log|z| + i \operatorname{Arg} z$ (WTS that $L = \operatorname{Log}$).

$L(1) = 0 = \operatorname{Log}(1)$, good!

$e^{L(z)} = e^{\log|z|} e^{i \operatorname{Arg} z} = |z| e^{i \operatorname{Arg} z} = z.$

L is the inverse of the exponential $\Rightarrow$ L is holomorphic.

Differentiate $z = e^{L(z)}$: $1 = L'(z) e^{L(z)} = L'(z) z.$

Et voilà!

Set $L(z) = \log|z| + i \operatorname{Arg} z$ (WTS that $L = \operatorname{Log}$).

$L(1) = 0 = \operatorname{Log}(1)$, good!

$e^{L(z)} = e^{\log|z|} e^{i \operatorname{Arg} z} = |z| e^{i \operatorname{Arg} z} = z.$

L is the inverse of the exponential $\Rightarrow$ L is holomorphic.

Differentiate $z = e^{L(z)}$: $1 = L'(z) e^{L(z)} = L'(z) z.$

Et voilà!

Using a different branch of the argument gets another antiderivative.

Set $L(z) = \log|z| + i\operatorname{Arg} z \qquad$ (WTS that $L = \operatorname{Log}$).

$L(1) = 0 = \operatorname{Log}(1)$, good!

$e^{L(z)} = e^{\log|z|}e^{i\operatorname{Arg} z} = |z|e^{i\operatorname{Arg} z} = z.$

L is the inverse of the exponential $\quad\Rightarrow\quad$ L is holomorphic.

Differentiate $z = e^{L(z)}$: $\qquad 1 = L'(z)e^{L(z)} = L'(z)z.$

Et voilà!

Using a different branch of the argument gets another antiderivative.

Emboldened, we define

$$\log z \stackrel{\text{def}}{=} \log|z| + i\arg z.$$

Set $L(z) = \log|z| + i \operatorname{Arg} z$ (WTS that $L = \operatorname{Log}$).

$L(1) = 0 = \operatorname{Log}(1)$, good!

$e^{L(z)} = e^{\log|z|} e^{i \operatorname{Arg} z} = |z| e^{i \operatorname{Arg} z} = z.$

L is the inverse of the exponential $\Rightarrow$ L is holomorphic.

Differentiate $z = e^{L(z)}$: $1 = L'(z) e^{L(z)} = L'(z) z.$

Et voilà!

Using a different branch of the argument gets another antiderivative.

Emboldened, we define

$$\log z \overset{\text{def}}{=} \log|z| + i \arg z.$$

That sounds crazy:

Set $L(z) = \log|z| + i \operatorname{Arg} z$ (WTS that $L = \operatorname{Log}$).

$L(1) = 0 = \operatorname{Log}(1)$, good!

$e^{L(z)} = e^{\log|z|} e^{i \operatorname{Arg} z} = |z| e^{i \operatorname{Arg} z} = z.$

L is the inverse of the exponential $\Rightarrow$ L is holomorphic.

Differentiate $z = e^{L(z)}$: $1 = L'(z) e^{L(z)} = L'(z) z.$

Et voilà!

Using a different branch of the argument gets another antiderivative.

Emboldened, we define

$$\log z \stackrel{\text{def}}{=} \log|z| + i \arg z.$$

That sounds crazy:
1) The log on the right (the real log) is different than the log on the left, and

Set $L(z) = \log|z| + i \operatorname{Arg} z$ (WTS that $L = \operatorname{Log}$).

$L(1) = 0 = \operatorname{Log}(1)$, good!

$e^{L(z)} = e^{\log|z|} e^{i \operatorname{Arg} z} = |z| e^{i \operatorname{Arg} z} = z.$

L is the inverse of the exponential $\Rightarrow$ L is holomorphic.

Differentiate $z = e^{L(z)}$: $1 = L'(z) e^{L(z)} = L'(z) z.$

Et voilà!

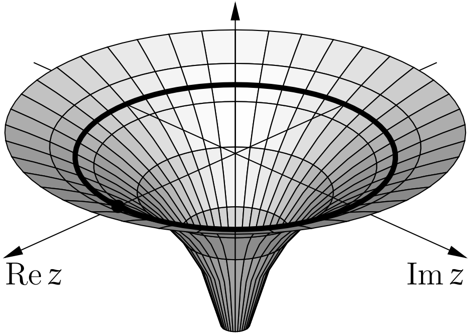
Using a different branch of the argument gets another antiderivative.

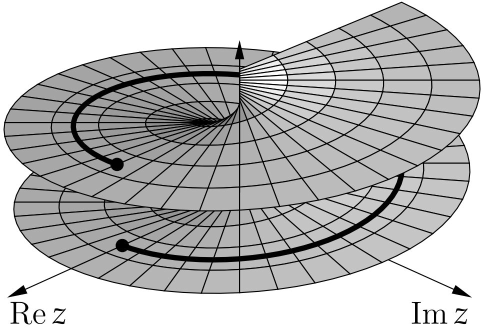
Emboldened, we define

$$\log z \overset{\text{def}}{=} \log|z| + i \arg z.$$

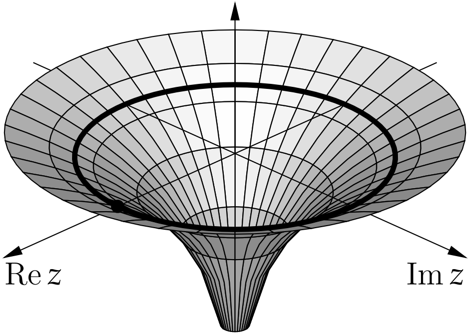
That sounds crazy:
1) The log on the right (the real log) is different than the log on the left, and
2) arg has infinitely many values.

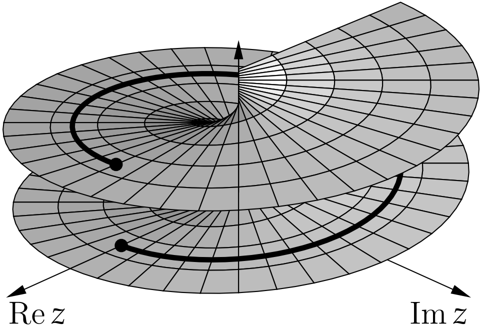
Here are the real and imaginary parts of $\log z = \log|z| + i \arg z$:





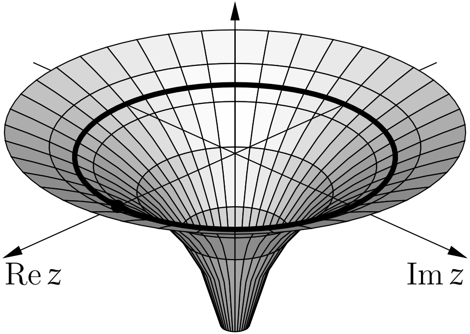
Here are the real and imaginary parts of $\log z = \log|z| + i \arg z$:

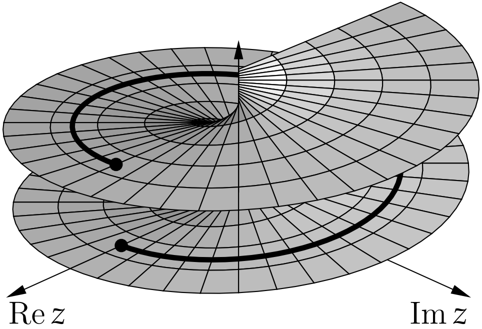




If we travel the unit circle in the z-plane, we travel the marked path on the graph.

Here are the real and imaginary parts of $\log z = \log|z| + i \arg z$:

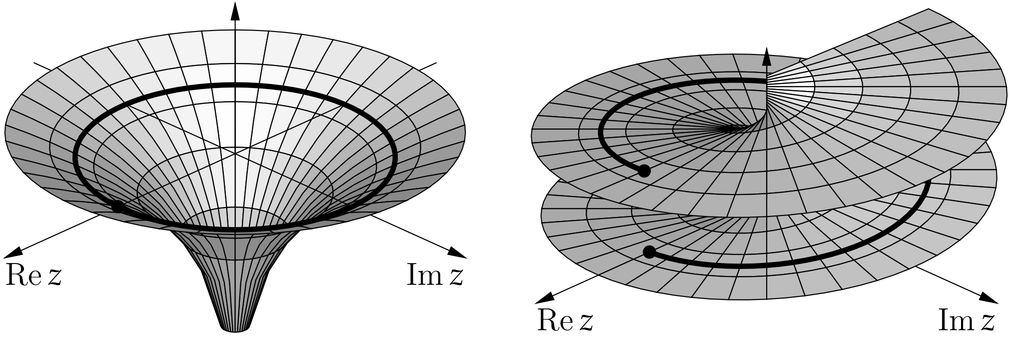




If we travel the unit circle in the z-plane, we travel the marked path on the graph.

The real part is a nice function, it is the normal real $\log\colon (0, \infty) \to \mathbb{R}$ applied to $|z|$.

Here are the real and imaginary parts of $\log z = \log|z| + i \arg z$:

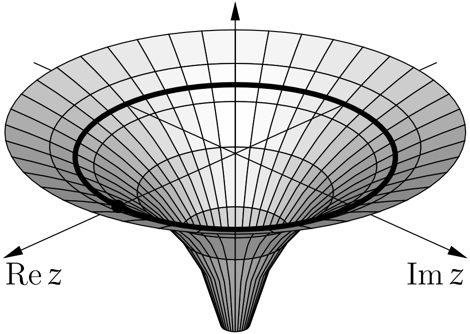


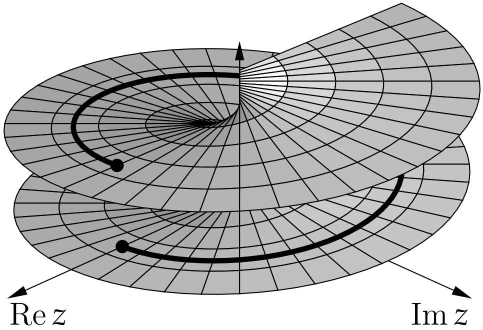
If we travel the unit circle in the z-plane, we travel the marked path on the graph.

The real part is a nice function, it is the normal real $\log\colon (0, \infty) \to \mathbb{R}$ applied to $|z|$.

The imaginary part has infinitely many values.

Here are the real and imaginary parts of $\log z = \log|z| + i \arg z$:





If we travel the unit circle in the z-plane, we travel the marked path on the graph.

The real part is a nice function, it is the normal real $\log\colon (0, \infty) \to \mathbb{R}$ applied to $|z|$.

The imaginary part has infinitely many values.

Nevertheless, it is the correct definition. Much more useful than the principal branch.

How do we use log? To compute line integrals:

How do we use log? To compute line integrals:

Parametrize $\partial\mathbb{D}$ starting and ending at $z = 1$ and compute:

$$\int_{\partial\mathbb{D}} \frac{1}{z}\, dz$$

How do we use log? To compute line integrals:

Parametrize $\partial\mathbb{D}$ starting and ending at $z = 1$ and compute:

$$\int_{\partial\mathbb{D}} \frac{1}{z}\,dz = \log 1 - \log 1$$

How do we use log? To compute line integrals:

Parametrize $\partial\mathbb{D}$ starting and ending at $z = 1$ and compute:

$$\int_{\partial\mathbb{D}} \frac{1}{z}\, dz = \log 1 - \log 1 = 2\pi i.$$

How do we use log? To compute line integrals:

Parametrize $\partial\mathbb{D}$ starting and ending at $z = 1$ and compute:

$$\int_{\partial\mathbb{D}} \frac{1}{z}\, dz = \log 1 - \log 1 = 2\pi i.$$

That's nonsense! Let's make it better:

How do we use log? To compute line integrals:

Parametrize $\partial\mathbb{D}$ starting and ending at $z = 1$ and compute:

$$\int_{\partial\mathbb{D}} \frac{1}{z}\,dz = \log 1 - \log 1 = 2\pi i.$$

That's nonsense! Let's make it better:

$$\int_{\partial\mathbb{D}} \frac{1}{z}\,dz \;\text{“=”}\; \log 1 - \log 1 \;\text{“=”}\; 2\pi i.$$

How do we use log? To compute line integrals:

$$\int_{\partial\mathbb{D}} \frac{1}{z}\,dz \;\text{“=”}\; \log 1 - \log 1 \;\text{“=”}\; 2\pi i.$$

Maybe still not quite right.

It works by following one “branch” of the logarithm along the path and then subtracting.

How do we use log? To compute line integrals:

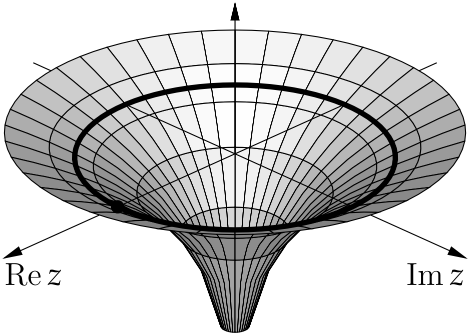
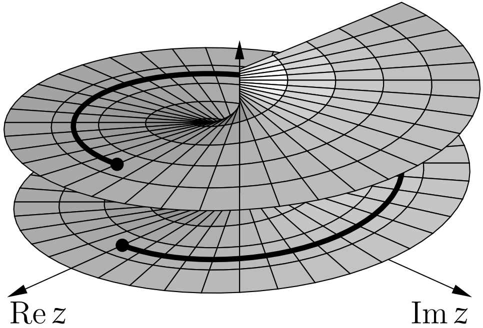
It works by following one “branch” of the logarithm along the path and then subtracting.

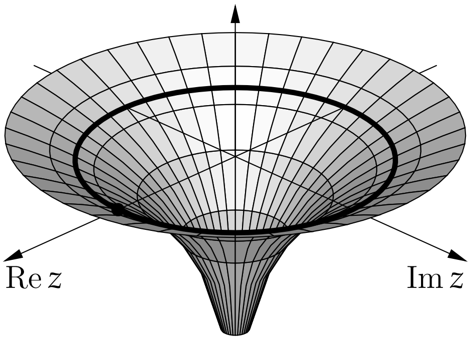
Let's see that graph again.

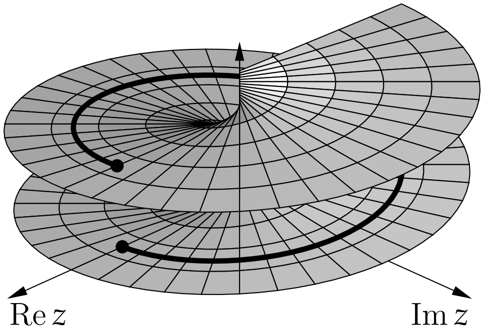


Re z
Im z

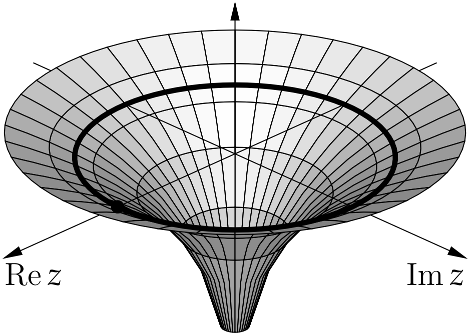


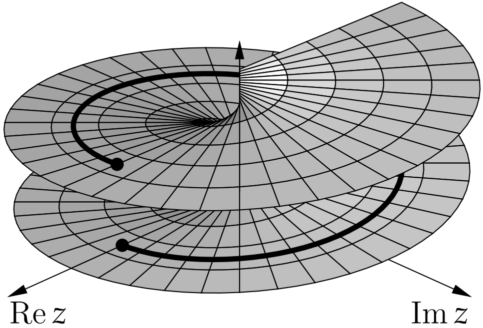
Re z
Im z





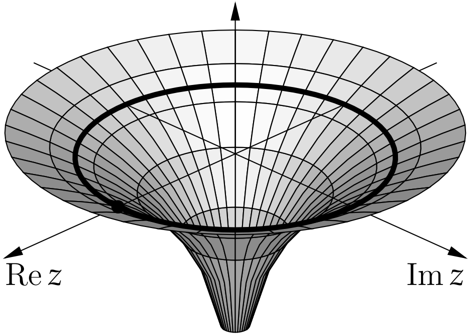
What we do:

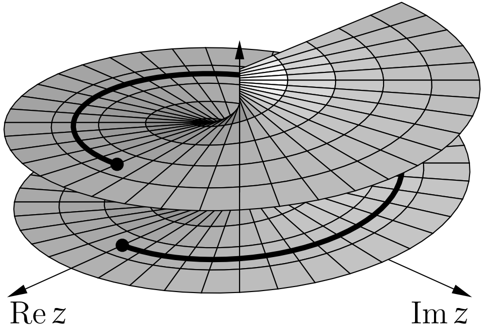




What we do:

We start with the value $\log 1 = 0$.





What we do:

We start with the value $\log 1 = 0$.

Then we follow the graph around the circle until we end at $\log 1 = 2\pi i$.

A *branch* of the logarithm in U is an antiderivative of $1/z$ in U that equals one value of $\log z$ at every point.

A *branch* of the logarithm in U is an antiderivative of $1/z$ in U that equals one value of $\log z$ at every point.

We *follow a branch* along a path by taking a branch in a (small enough) neighborhood,

A *branch* of the logarithm in U is an antiderivative of $1/z$ in U that equals one value of $\log z$ at every point.

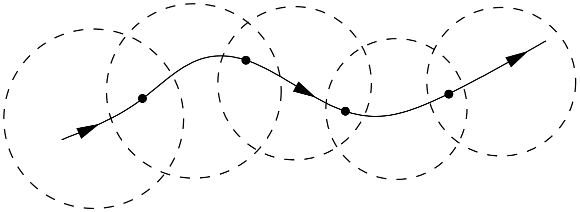
We *follow a branch* along a path by taking a branch in a (small enough) neighborhood, then change to another branch in another neighborhood (equal at some point).

A *branch* of the logarithm in U is an antiderivative of $1/z$ in U that equals one value of $\log z$ at every point.

We *follow a branch* along a path by taking a branch in a (small enough) neighborhood, then change to another branch in another neighborhood (equal at some point). Etc.

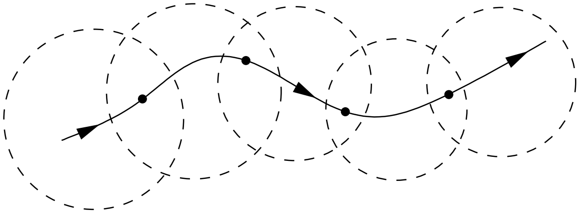
A *branch* of the logarithm in U is an antiderivative of $^1/_z$ in U that equals one value of $\log z$ at every point.

We *follow a branch* along a path by taking a branch in a (small enough) neighborhood, then change to another branch in another neighborhood (equal at some point). Etc.



A *branch* of the logarithm in U is an antiderivative of $1/z$ in U that equals one value of $\log z$ at every point.

We *follow a branch* along a path by taking a branch in a (small enough) neighborhood, then change to another branch in another neighborhood (equal at some point). Etc.



That's what we did in the computation above.
