Cultivating Complex Analysis: Riemann mapping theorem (6.3.1)

Jiří Lebl

Departemento pri Matematiko de Oklahoma Ŝtata Universitato

Riemann mapping theorem: The only simply connected domains in $\mathbb{C}$ (up to biholomorphisms) are $\mathbb{C}$ and $\mathbb{D}$.

Riemann mapping theorem: The only simply connected domains in $\mathbb{C}$ (up to biholomorphisms) are $\mathbb{C}$ and $\mathbb{D}$.

More precisely:

Theorem (Riemann mapping theorem)

Let $U \subset \mathbb{C}$ be a simply connected domain such that $U \neq \mathbb{C}$. Let $p \in U$ be given. Then there exists a unique biholomorphic (conformal) map $f : U \to \mathbb{D}$ such that $f(p) = 0$ and $f'(p) > 0$.

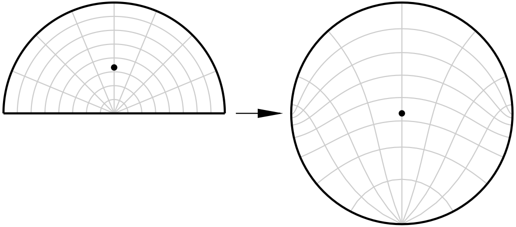
Riemann mapping theorem: The only simply connected domains in $\mathbb{C}$ (up to biholomorphisms) are $\mathbb{C}$ and $\mathbb{D}$.

More precisely:

Theorem (Riemann mapping theorem)

Let $U \subset \mathbb{C}$ be a simply connected domain such that $U \neq \mathbb{C}$. Let $p \in U$ be given. Then there exists a unique biholomorphic (conformal) map $f : U \longrightarrow \mathbb{D}$ such that $f(p) = 0$ and $f'(p) > 0$.

$U =$ the upper half disk
$p = (\sqrt{2} - 1)i$



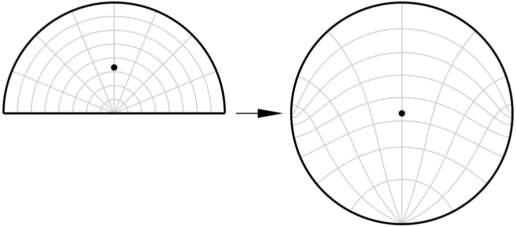
Riemann mapping theorem: The only simply connected domains in $\mathbb{C}$ (up to biholomorphisms) are $\mathbb{C}$ and $\mathbb{D}$.

More precisely:

Theorem (Riemann mapping theorem)

Let $U \subset \mathbb{C}$ be a simply connected domain such that $U \neq \mathbb{C}$. Let $p \in U$ be given. Then there exists a unique biholomorphic (conformal) map $f : U \to \mathbb{D}$ such that $f(p) = 0$ and $f'(p) > 0$.

$U =$ the upper half disk
$p = (\sqrt{2} - 1)i$



Proof is to "maximize" $|f'(p)|$ among all maps into the disc and $f(p) = 0$.

Theorem (Riemann mapping theorem)

Let $U \subset \mathbb{C}$ *be a simply connected domain such that* $U \neq \mathbb{C}$*. Let* $p \in U$ *be given. Then there exists a unique biholomorphic map* $f : U \longrightarrow \mathbb{D}$ *such that* $f(p) = 0$ *and* $f'(p) > 0$*.*

Theorem (Riemann mapping theorem)

Let $U \subset \mathbb{C}$ be a simply connected domain such that $U \neq \mathbb{C}$. Let $p \in U$ be given. Then there exists a unique biholomorphic map $f : U \to \mathbb{D}$ such that $f(p) = 0$ and $f'(p) > 0$.

Proof: Let $\mathcal{F}$ be the set of injective holomorphic $f : U \to \mathbb{D}$ such that $f(p) = 0$.

Theorem (Riemann mapping theorem)

Let $U \subset \mathbb{C}$ be a simply connected domain such that $U \neq \mathbb{C}$. Let $p \in U$ be given. Then there exists a unique biholomorphic map $f : U \to \mathbb{D}$ such that $f(p) = 0$ and $f'(p) > 0$.

Proof: Let $\mathcal{F}$ be the set of injective holomorphic $f : U \to \mathbb{D}$ such that $f(p) = 0$.

First we need to prove that $\mathcal{F}$ is nonempty:

Theorem (Riemann mapping theorem)

Let $U \subset \mathbb{C}$ be a simply connected domain such that $U \neq \mathbb{C}$. Let $p \in U$ be given. Then there exists a unique biholomorphic map $f : U \to \mathbb{D}$ such that $f(p) = 0$ and $f'(p) > 0$.

Proof: Let $\mathcal{F}$ be the set of injective holomorphic $f : U \to \mathbb{D}$ such that $f(p) = 0$.

First we need to prove that $\mathcal{F}$ is nonempty:

Let $q \in \mathbb{C} \setminus U$.

Theorem (Riemann mapping theorem)

Let $U \subset \mathbb{C}$ be a simply connected domain such that $U \neq \mathbb{C}$. Let $p \in U$ be given. Then there exists a unique biholomorphic map $f\colon U \to \mathbb{D}$ such that $f(p) = 0$ and $f'(p) > 0$.

Proof: Let $\mathcal{F}$ be the set of injective holomorphic $f\colon U \to \mathbb{D}$ such that $f(p) = 0$.

First we need to prove that $\mathcal{F}$ is nonempty:

Let $q \in \mathbb{C} \setminus U$. $\quad \exists\, g\colon U \to \mathbb{C}$ such that $\big(g(z)\big)^2 = z - q \quad$ (U simply connected).

Theorem (Riemann mapping theorem)

Let $U \subset \mathbb{C}$ be a simply connected domain such that $U \neq \mathbb{C}$. Let $p \in U$ be given. Then there exists a unique biholomorphic map $f: U \to \mathbb{D}$ such that $f(p) = 0$ and $f'(p) > 0$.

Proof: Let $\mathcal{F}$ be the set of injective holomorphic $f: U \to \mathbb{D}$ such that $f(p) = 0$.

First we need to prove that $\mathcal{F}$ is nonempty:

Let $q \in \mathbb{C} \setminus U$. $\quad \exists\, g: U \to \mathbb{C}$ such that $\big(g(z)\big)^2 = z - q \quad$ (U simply connected).

$g(z) = g(\zeta)$

Theorem (Riemann mapping theorem)

Let $U \subset \mathbb{C}$ be a simply connected domain such that $U \neq \mathbb{C}$. Let $p \in U$ be given. Then there exists a unique biholomorphic map $f \colon U \to \mathbb{D}$ such that $f(p) = 0$ and $f'(p) > 0$.

Proof: Let $\mathcal{F}$ be the set of injective holomorphic $f \colon U \to \mathbb{D}$ such that $f(p) = 0$.

First we need to prove that $\mathcal{F}$ is nonempty:

Let $q \in \mathbb{C} \setminus U$. $\quad \exists\, g \colon U \to \mathbb{C}$ such that $\big(g(z)\big)^2 = z - q \quad$ (U simply connected).

$$g(z) = g(\zeta) \quad \Rightarrow \quad \big(g(z)\big)^2 = \big(g(\zeta)\big)^2$$

Theorem (Riemann mapping theorem)

Let $U \subset \mathbb{C}$ be a simply connected domain such that $U \neq \mathbb{C}$. Let $p \in U$ be given. Then there exists a unique biholomorphic map $f\colon U \to \mathbb{D}$ such that $f(p) = 0$ and $f'(p) > 0$.

Proof: Let $\mathcal{F}$ be the set of injective holomorphic $f\colon U \to \mathbb{D}$ such that $f(p) = 0$.

First we need to prove that $\mathcal{F}$ is nonempty:

Let $q \in \mathbb{C} \setminus U$. $\quad \exists\, g\colon U \to \mathbb{C}$ such that $\big(g(z)\big)^2 = z - q \quad$ (U simply connected).

$$g(z) = g(\zeta) \quad \Rightarrow \quad \big(g(z)\big)^2 = \big(g(\zeta)\big)^2 \quad \Rightarrow \quad z = \zeta$$

Theorem (Riemann mapping theorem)

Let $U \subset \mathbb{C}$ be a simply connected domain such that $U \neq \mathbb{C}$. Let $p \in U$ be given. Then there exists a unique biholomorphic map $f\colon U \to \mathbb{D}$ such that $f(p) = 0$ and $f'(p) > 0$.

Proof: Let $\mathcal{F}$ be the set of injective holomorphic $f\colon U \to \mathbb{D}$ such that $f(p) = 0$.

First we need to prove that $\mathcal{F}$ is nonempty:

Let $q \in \mathbb{C} \setminus U$. $\quad \exists\, g\colon U \to \mathbb{C}$ such that $\big(g(z)\big)^2 = z - q \quad$ (U simply connected).

$g(z) = g(\zeta) \quad \Rightarrow \quad \big(g(z)\big)^2 = \big(g(\zeta)\big)^2 \quad \Rightarrow \quad z = \zeta \quad \Rightarrow \quad g$ is injective.

Theorem (Riemann mapping theorem)

Let $U \subset \mathbb{C}$ be a simply connected domain such that $U \neq \mathbb{C}$. Let $p \in U$ be given. Then there exists a unique biholomorphic map $f \colon U \to \mathbb{D}$ such that $f(p) = 0$ and $f'(p) > 0$.

Proof: Let $\mathcal{F}$ be the set of injective holomorphic $f \colon U \to \mathbb{D}$ such that $f(p) = 0$.

First we need to prove that $\mathcal{F}$ is nonempty:

Let $q \in \mathbb{C} \setminus U$. $\quad \exists\, g \colon U \to \mathbb{C}$ such that $\big(g(z)\big)^2 = z - q \quad$ (U simply connected).

$g(z) = g(\zeta) \quad \Rightarrow \quad \big(g(z)\big)^2 = \big(g(\zeta)\big)^2 \quad \Rightarrow \quad z = \zeta \quad \Rightarrow \quad g$ is injective.

$g(z) = -g(\zeta)$

Theorem (Riemann mapping theorem)

Let $U \subset \mathbb{C}$ be a simply connected domain such that $U \neq \mathbb{C}$. Let $p \in U$ be given. Then there exists a unique biholomorphic map $f : U \to \mathbb{D}$ such that $f(p) = 0$ and $f'(p) > 0$.

Proof: Let $\mathcal{F}$ be the set of injective holomorphic $f : U \to \mathbb{D}$ such that $f(p) = 0$.

First we need to prove that $\mathcal{F}$ is nonempty:

Let $q \in \mathbb{C} \setminus U$. $\quad \exists\, g : U \to \mathbb{C}$ such that $\big(g(z)\big)^2 = z - q \quad$ (U simply connected).

$g(z) = g(\zeta) \quad \Rightarrow \quad \big(g(z)\big)^2 = \big(g(\zeta)\big)^2 \quad \Rightarrow \quad z = \zeta \quad \Rightarrow \quad g$ is injective.

$g(z) = -g(\zeta) \quad \Rightarrow \quad \big(g(z)\big)^2 = \big(g(\zeta)\big)^2$

Theorem (Riemann mapping theorem)

Let $U \subset \mathbb{C}$ be a simply connected domain such that $U \neq \mathbb{C}$. Let $p \in U$ be given. Then there exists a unique biholomorphic map $f\colon U \to \mathbb{D}$ such that $f(p) = 0$ and $f'(p) > 0$.

Proof: Let $\mathcal{F}$ be the set of injective holomorphic $f\colon U \to \mathbb{D}$ such that $f(p) = 0$.

First we need to prove that $\mathcal{F}$ is nonempty:

Let $q \in \mathbb{C} \setminus U$. $\quad \exists\, g\colon U \to \mathbb{C}$ such that $\big(g(z)\big)^2 = z - q \quad$ (U simply connected).

$g(z) = g(\zeta) \quad \Rightarrow \quad \big(g(z)\big)^2 = \big(g(\zeta)\big)^2 \quad \Rightarrow \quad z = \zeta \quad \Rightarrow \quad g$ is injective.

$g(z) = -g(\zeta) \quad \Rightarrow \quad \big(g(z)\big)^2 = \big(g(\zeta)\big)^2 \quad \Rightarrow \quad z = \zeta$

Theorem (Riemann mapping theorem)

Let $U \subset \mathbb{C}$ be a simply connected domain such that $U \neq \mathbb{C}$. Let $p \in U$ be given. Then there exists a unique biholomorphic map $f : U \to \mathbb{D}$ such that $f(p) = 0$ and $f'(p) > 0$.

Proof: Let $\mathcal{F}$ be the set of injective holomorphic $f : U \to \mathbb{D}$ such that $f(p) = 0$.

First we need to prove that $\mathcal{F}$ is nonempty:

Let $q \in \mathbb{C} \setminus U$. $\quad \exists\, g : U \to \mathbb{C}$ such that $\big(g(z)\big)^2 = z - q \quad$ (U simply connected).

$g(z) = g(\zeta) \quad \Rightarrow \quad \big(g(z)\big)^2 = \big(g(\zeta)\big)^2 \quad \Rightarrow \quad z = \zeta \quad \Rightarrow \quad g$ is injective.

$g(z) = -g(\zeta) \quad \Rightarrow \quad \big(g(z)\big)^2 = \big(g(\zeta)\big)^2 \quad \Rightarrow \quad z = \zeta \quad \Rightarrow \quad$ contradiction (g is never zero).

Theorem (Riemann mapping theorem)

Let $U \subset \mathbb{C}$ be a simply connected domain such that $U \neq \mathbb{C}$. Let $p \in U$ be given. Then there exists a unique biholomorphic map $f : U \to \mathbb{D}$ such that $f(p) = 0$ and $f'(p) > 0$.

Proof: Let $\mathcal{F}$ be the set of injective holomorphic $f : U \to \mathbb{D}$ such that $f(p) = 0$.

First we need to prove that $\mathcal{F}$ is nonempty:

Let $q \in \mathbb{C} \setminus U$. $\quad \exists\, g : U \to \mathbb{C}$ such that $\big(g(z)\big)^2 = z - q \quad$ (U simply connected).

$g(z) = g(\zeta) \quad \Rightarrow \quad \big(g(z)\big)^2 = \big(g(\zeta)\big)^2 \quad \Rightarrow \quad z = \zeta \quad \Rightarrow \quad g$ is injective.

$g(z) = -g(\zeta) \quad \Rightarrow \quad \big(g(z)\big)^2 = \big(g(\zeta)\big)^2 \quad \Rightarrow \quad z = \zeta \quad \Rightarrow \quad$ contradiction (g is never zero).

$\Rightarrow \quad g(U) \cap \big(-g(U)\big) = \emptyset \quad$ where $-g(U) = \{z \in \mathbb{C} : -z \in g(U)\}$.

Theorem (Riemann mapping theorem)

Let $U \subset \mathbb{C}$ be a simply connected domain such that $U \neq \mathbb{C}$. Let $p \in U$ be given. Then there exists a unique biholomorphic map $f : U \to \mathbb{D}$ such that $f(p) = 0$ and $f'(p) > 0$.

Montel says ($\mathcal{F}$ is uniformly bounded), there exists a convergent subsequence, WLOG $\{f_n\}$ converges to f.

By the corollary to Hurwitz, f is injective or constant.

By taking limits: $|f'(p)| > 0$ (f not constant), $\quad f(p) = 0, \quad |f(z)| \leq 1$ for all $z \in U$.
Open mapping theorem $\quad\Rightarrow\quad |f(z)| < 1$ for all $z \in U$.

Construct a sequence $\{f_n\}$ in $\mathcal{F}$ such that

$$\lim_{n\to\infty} |f_n'(p)| = \sup_{f\in\mathcal{F}} |f'(p)|$$

Montel says ($\mathcal{F}$ is uniformly bounded), there exists a convergent subsequence, WLOG $\{f_n\}$ converges to f.

By the corollary to Hurwitz, f is injective or constant.

By taking limits: $|f'(p)| > 0$ (f not constant), $\quad f(p) = 0, \quad |f(z)| \le 1$ for all $z \in U$.
Open mapping theorem $\quad \Rightarrow \quad |f(z)| < 1$ for all $z \in U$.

f must be onto, otherwise there would be an $h \in \mathcal{F}$ with $|f'(p)| < |h'(p)|$.

Construct a sequence $\{f_n\}$ in $\mathcal{F}$ such that

$$\lim_{n\to\infty} |f_n'(p)| = \sup_{f\in\mathcal{F}} |f'(p)|$$

Montel says ($\mathcal{F}$ is uniformly bounded), there exists a convergent subsequence, WLOG $\{f_n\}$ converges to f.

By the corollary to Hurwitz, f is injective or constant.

By taking limits: $|f'(p)| > 0$ (f not constant), $\quad f(p) = 0, \quad |f(z)| \leq 1$ for all $z \in U$.
Open mapping theorem $\quad \Rightarrow \quad |f(z)| < 1$ for all $z \in U$.

f must be onto, otherwise there would be an $h \in \mathcal{F}$ with $|f'(p)| < |h'(p)|$.

Uniqueness left as an exercise. □

Remark: An explicit map is useful, e.g., in differential equations.

Remark: An explicit map is useful, e.g., in differential equations. The theorem doesn't answer how a map is constructed.

Remark: An explicit map is useful, e.g., in differential equations.
The theorem doesn't answer how a map is constructed.
There is lots of literature on constructing the map.

Remark: An explicit map is useful, e.g., in differential equations.
The theorem doesn't answer how a map is constructed.
There is lots of literature on constructing the map.
E.g., if U is a polygon, there is an explicit formula: the Schwarz–Christoffel mapping.
